

I claim:

1. A system for providing media content in a network comprising one or more servers configured to:  
  
generate an interface at a site on said network, said interface having consistent features and navigation capabilities regardless of the content selected;  
  
collect a plurality of media files for use with said interface;  
  
associate metadata attributes with each of said plurality of media files; and  
  
map certain of said metadata attributes to locations in said interface.
2. The system of claim 1 wherein the plurality of media files are provided by more than one source.
3. The system of claim 1 wherein the one or more servers are further configured to generate a player interface for experiencing the media content.
4. A system for providing media content in a network comprising one or more servers configured to:  
  
define metadata attributes with a plurality of media files;  
  
use the metadata attributes to map the plurality of media files to an interface such that the interface is consistent for each of the plurality of media files.
5. The system of claim 4 further comprising:  
a local database for storing the metadata attributes.
6. The system of claim 4 wherein the plurality of media files are provided by more than one source.
7. A method of providing media content to one or more users over a network comprising:  
  
compiling a data file that contains one or more sequentially placed unique identifiers which identify one or more media files;  
  
allowing the one or more users to access the one or more media files out of sequence.
8. The method of claim 7 wherein the data file is automatically compiled based on some criteria.
9. The method of claim 8 wherein the data file is automatically compiled based on some chosen criteria.

10. The method of claim 7 wherein the data file is compiled manually.
11. The method of claim 7 wherein the one or more media files are provided by more than one source.
12. A system for providing media content to one or more users comprising one or more servers configured to:
  - compile a data file that contains one or more sequentially placed unique identifiers which identify one or more pieces of content;
  - allow the one or more users to access the one or more media files out of sequence.
13. The system of claim 12 wherein the data file is automatically compiled.
14. The system of claim 13 wherein the data file is automatically compiled based on some chosen criteria.
15. The system of claim 12 wherein the data file is compiled manually.
16. The system of claim 12 wherein the one or more media files are provided by more than one source.
17. A computer readable medium comprising computer code for providing content to a user over a network, the computer code to configure one or more processors to:
  - compile a data file that contains one or more sequentially placed unique identifiers which identify one or more pieces of content;
  - allow a user to access the one or more items of content within the data file out of sequence.
